

Divs

Styling with CSS

We know we can use CSS to select groups of elements and style them

Styling with CSS

What if we want to select several different elements and apply the same style to all of them?

Styling with CSS

What if we want to select several different elements and apply the same style to all of them?

Option 1: Give ALL of those elements the same class and style that class

Styling with CSS

What if we want to select several different elements and apply the same style to all of them?

Option 1: Give ALL of those elements the same class and style that class

Option 2: Put all of those elements inside of a single div element and style that one div

Styling with CSS

What if we want to select several different elements and apply the same style to all of them?

Option 1: Give ALL of those elements the same class and style that class

Option 2: Put all of those elements inside of a single div element and style that one div

Introducing

The `<div>` Tag

The `<div>` tag defines a “division” or section of an HTML page. It simply groups a block of elements together so we can format them with CSS

Let's look at some examples
